                                                                                                                                                                                    The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an B6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (cLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                              AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used if preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fusion protein; E6 protein; E7 protein; E6/E7; immunomodulator; tumour; immunological fusion partner; CpG oligonucleotide; immune response; HPV antigen; prevention; treatment.

The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.
                                                                                                                                                                                                                                                 E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB; AED52643.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CTIA4; E7; fusion protein; B7 receptor positive B cell; CTIA4 receptor positive T cell interaction; immune systautoimmune disease; lupus erythematosus; host-graft; transplant rejection; chimera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a soluble CTLA4 fusion protein, for use in the method of the invention. The specification describes a method for regulating CTLA4 receptor positive T cell interactions with B7 receptor positive B cells. The method comprises contacting the CTLA4-positive T cells with monoclonal antibody fragments reactive with CTLA4. This inhibits (and therefore regulates) interactions between CTLA4-positive T cells and B7 positive B cells. The method may be used for regulating CTLA4 receptor positive T cell interactions with B7 receptor positive B cells. In this way the immune system of an individual can be manipulated (especially lupus erythematosus) and to prevent host-graft and transplant rejection. (Updated on 27-AUG-2003 to correct OS field.) (Updated on 17-CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a CTLA4 receptor/immunoglobulin (Ig) fusion CC protein which is reactive with the B7 antigen. DNA encoding the CTLA4 CC protein can be used in a vector in a host vector system for producing CC soluble CTLA4. The CTLA4 fusion protein can be used for regulating T cell interactions with B7 positive cells. The CTLA4Ig fusion protein can be used for regulating T cell cused for treating immune system diseases mediated by T cell interactions CC with B7 positive cells. The immune diseases mediated by T cell interactions CC with B7 positive cells. The immune diseases include graft versus host disease, psoriasis, immune disorders associated with graft cransplant rejection, T cell lymphoma, benign lymphocytic angiitis, and CC transplant rejection, T cell lymphoma, benign lymphocytic angiitis, and CC autoimmune diseases such as lupus crythematosus, Grave's disease. The CC colitis, Sjogren's syndrome, and mixed connective tissue disease. The CC colitis, Sjogren's syndrome, and mixed connective tissue disease. The CC colitis, The present sequence was created in the course of the invention KC HTLVI. The present sequence was created in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides new monoclonal antibodies (MAbs) which bind the certracellular domain of CTLA4 and prevent the binding of CTLA4 to B7 CC antigen. The MAbs can be used for regulating T cell interactions with B7 CC positive cells. They can also be used for preventing or reversing CC diseases and neoplasia. They can be used for treating diseases e.g. graft versus host disease (GCHD), psoriasis, immune disorders associated with CC lymphoblastic leukemia, resticular angiocentric R cell lymphoma, benign CC lymphocytic angitts, autoimmune diseases such as lugus erythematosus, CC anshimoto's thryoiditis, primary myxedema, Graves disease, pernicious CC anemia, autoimmune atrophic gastritis, Addison's disease, pernicious continue such esticular angioty myxedema, Graves disease, insulin CC dependent diabetes mellitis, Goodpasture's syndrome, myasthenia gravis, CC pemphigus, Crohn's disease, sympathetic ophthalmia, autoimmune uveitis, CC ulcerative colitis, Sjogren's syndrome, rheumatoid arthritis, CC ulcerative colitis, Sjogren's syndrome, rheumatoid arthritis, CC diseases. The present sequence represents the CTLA4/E7 fusion protein CC domain an amino terminal CTLA4 domain and a E7 carboxy-terminal CC domain of the cerminal CTLA4 domain and a E7 carboxy-terminal CC domain.

                                                                                                                                                                                                                                                                                                                                                                                    This represents a CTLA4/E7 fusion protein. The invention provides a CTLA4 - Ig fusion protein that binds the B7 antigen and has a first amino acid sequence consisting of the extracellular domain of CTLA4 and a second amino acid sequence consisting of the hinge, CH2 and CH3 regions of a human immunoglobulin molecule. The fusion protein inhibits interaction of T cells with B7-positive cells and may be useful for treating immune system diseases, earcer or viral infections. The present sequence is an example of such a fusion protein and contains an amino-terminal CTLA4 domain and aN E7 carboxy- terminal domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fusion

CTLA4 is a receptor protein having a high degree of homology with CD28. The CTLA4 receptor is identified as a ligand for the B7 antigen. The CTLA4 protein can also be used to construct a fusion protein of CTLA4 and human immunoglobulin (IG)-gammal. The CTLA4 protein was fused to the hinge CH2 and CH3 regions of human IgC-gammal. Soluble CTLA4-Ig fusion proteins can be used to regulate T-cell interactions with B7-positive cells and to

Such vaccines can efficiently express antigen in infected cells, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to the HPV type 16 E7 protein whose encoding gene is used as the gene of interest in the recombinant replicon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A dengue virus recombinant replicon has a deletion of the complete coding sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NS1 protein signal; coding regions of all non-structural proteins. The

The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-JAN-2003; 2003CN-00115272

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two-thirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 mostly fused to a full length E7 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence is a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse; granulocyte-macrophage-colony stimulating factor; GM-CSF; chimeric; heat shock protein; HSP; Flt-3 ligand; FL; exotoxin A; ET antigenic; immunogenic; cytotoxic T cell response; tumour; vaccine;
New chimeric polypeptide, useful as anti-tumor vaccines, comprises carboxy terminal fragment of heat shock protein, Flt-3 ligand or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA by gene gun or equivalent, or by liposomal formulation. These are thus useful for vaccinating a mammal against infection by inducing an immune response to a pathogen. Perferably they are useful for vaccinating a mammal against a tumour antigen. The compositions and methods are useful for stimulating or enhancing the immunogenicity of a selected antigen or stimulating or enhancing a cellular immune response specific for that antigen. The cohimeric nucleic acid molecules and vaccination methods, yield potent antigen-specific immunotherapy. The polynucleotides and DNA vaccines can induce a cellular immune response that is at least 40 fold more potent than conventional DNA vaccines. The vaccines are safe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of a Pseudomonas exotoxin A (ETA dII), or a granulocyte-macrophage colony stimulating factor (GM-CSF); and (b) a second polypeptide domain containing an antigenic polypeptide. A composition comprising the chimeric polypeptide is useful for inducing an immune response such as a cytotoxic T cell response. The nucleic acid or vector encoding the chimeric polypeptide present in the composition is administered as naked that he composition is administered as naked that he composition is administered as naked that the composition is a composition of the composition is administration in the composition is administration in the composition of the composition is administration in the composit

The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

The E7 protein was used to construct a fusion protein with Mycobacterium bovis heat shock proteins (Hsp). The fusion proteins are used in the method of the compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fusion partner; immunogenicity; chimeric.
                                                                                                                                                                                                                     A new DNA sequence encoding a fusion protein comprising a mutagenized H (human papillomavirus) E6 or E7 coding sequence and a sequence encoding highly immunogenic fusion partner is useful to vaccinate against HPV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ч
```

The invention relates to a new DNA sequence encodes an E6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced codons which lead to enhanced translation in a mammalian cell, containi a mutation which results in production of a truncated non-functional

                                                                                                                                                                                                                                                                                                                                                                                                                          encoding encoding
The invention relates to a novel nucleic acid composition useful as an immunogen. The composition comprises a combination of: a first nucleic acid vector comprising a first sequence encoding an antigenic polypeptid or peptide, and optionally, a second sequence linked to the first sequence and encoding an immunogenicity-potentiating polypeptide (IPP); and a second nucleic acid vector encoding an anti-apoptotic polypeptide. When the second vector is administered with the first vector to a subject, a T cell mediated immune response to the antigenic polypeptide or peptide is induced that is greater in magnitude and/or duration than an immune response induced by administration of the first vector alone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein, and encoding a highly immunogenic polypeptide fusion partner capable of enhancing immunogenicity of the E6 or E7 protein in the mammalian host. The invention is used as a vaccine for the prevention treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the HbsAg-EE7T fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24-FEB-2003; 2003US-0449429P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention further includes: a particle comprising a material that is suitable for introduction into a cell or an animal by particle bombardment, bound to which is the first and second vectors or composition; a pharmaceutical composition capable of inducing or enhancing an antigen specific immune response, comprising the particle and a carrier or an excipient; inducing or enhancing an antigen specific immune response in a subject; increasing the numbers of CD8+ CTLs specific for a selected desired antigen in a subject; and inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as an immunogen for inhibiting the growth of a tumor, hence it has cyrostatic activity. This sequence represents ananti-apoptotic vector E7-DCI_XI. To the invention of the invention.
                                                                                                                                                                                                                                                              24-FEB-2003;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    96
```

The invention relates to a novel nucleic acid composition useful as an immunogen. The composition comprises a combination of: a first nucleic acid vector comprising a first sequence encoding an antigenic polypeptide or peptide, and optionally, a second sequence linked to the first sequence and encoding an immunogenicity-potentiating polypeptide (IPP);

CC When the second vector is administered with the first vector to a

CC subject, a T cell mediated immune response to the antigenic polypeptide

CC or peptide is induced that is greater in magnitude and/or duration than

CC an immune response induced by administration of the first vector alone.

CC The invention further includes: a particle comprising a material that is

CC suitable for introduction into a cell or an animal by particle

CC bombardment, bound to which is the first and second vectors or

CC composition; a pharmaceutical composition capable of inducing or

CC composition; a pharmaceutical composition capable of inducing or

CC and a carrier or an excipient; inducing or enhancing an antigen specific

CC immune response in a subject; increasing the numbers of CDB+ CTLs

CC specific for a selected desired antigen in a subject; and inhibiting the

CC growth of a tumor in a subject. The nucleic acid composition is useful as

CC an immunogen for inhibiting the growth of a tumor, hence it has

CC cytostatic activity. This sequence represents ananti-apoptotic vector E7-

CC mtBCL-xL fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                     This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (RPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophillus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce a immune response in a patient to an HPV antigen. They can also be used preventing or treating HPV induced tumours

Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pusion protein; E6 protein; E7 protein; E6/E7; immu immunological fusion partner; CpG oligonucleotide; HPV antigen; prevention; treatment.

The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (cLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 390 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a triple fusion protein comprising, from CC the N-terminal end, Escherichia coli thioredoxin, human ubiquitin and human papillomavirus Proteinly/3 E7, followed by a histidine affinity tail. The triple fusion protein was produced in E. coli G1724 host cells CC transformed by an expression vector comprising DNA (see ABA91285) encoding the fusion. This is an example of the production of triple considered method of protein of interest, in this case ProteinD1/3 E7. A CC chaimed method of producing a recombinant protein of interest involves: CC claimed method of producing a recombinant protein of interest involves: CC claimed method of producing a recombinant protein of interest involves: CC claimed method of producing a recombinant protein of interest involves: CC claimed method of producing a recombinant protein of the triple fusion and a ubiquitin-specific endoprotease (especially UBP1 from Saccharomyces cerevisiae); and recovering the recombinant protein directly from the bacterial cells after it has been subjected to the action of the ubiquitin-specific endoprotease in vivo. In the present case, expression is controlled by the addition of the tryptophan. The recombinant protein can used as a vaccine for cancer therapy. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a fusion protein comprising a Mycobacterium tuberculosis heat shock protein (Hsp) 40 fused at its 3' end to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specific antigen of human papillomavirus (HPV). The fusion protein can be expressed in collbacillus, microzymes and plants. The fusion protein can be used to make immunostimulant injections, as it can produce specific cell immune and humoral immune responses. It possesses prophylaxis and therapeutic capacity for preventing human papillomavirus (HPV) infection, but also can be used for immunotherapy of pointed condyloma, tumours and cancer caused by HPV. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
The present sequence represents a fusion protein comprising a Streptococcus pneumoniae heat shock protein (Hsp) 65 fused to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T

               The present sequence represents a fusion protein comprising a Aspergillus fumigatus heat shock protein (Hsp) 60 fused to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fission protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like response to the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like response to the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                            The present sequence is the protein sequence of human papillomavirus E7 cc oncoprotein. E7 promotes oncogenesis through an inhibition of p21Cip21 cc transport into the nucleus. E7 abrogates Raf-associated arrest and cc prevents inhibition of cyclin E-CDK2 activity without disrupting Raf cc induction of p21Cip21. E7 neither interacts with p21Cip1 nor derepresses p21Cip1-associated CDK2 activity, but instead reduces the association cc state levels of Akt, a regulator of p21Cip1 localisation, leading to loss co f p21Cip1 phosphorylation and accumulation of p21Cip1. E7 disrupts the cffects of Raf on Akt activity and prevents p21Cip1 nuclear accumulation. CC Maintenance of Akt activity is necessary and sufficient to bypass Raf carrest. The invention provides methods for identifying and using compounds capable of promoting the nuclear localization of p21Cip1. The methods can be used to inhibit aberrant cellular proliferation for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                              CC The present sequence represents a fusion protein, comprising E6 and E7 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E6E7PentM, and comprises an E6 amino terminus CC (where residues 63 and 106 have been replaced with glycine) and an E7 CC carboxy terminus (where residues 24, 26 and 91 have been replaced with CC glycine). E6E7PentM is representative of fusion proteins of the CC invention. The specification describes human papillomavirus E6 and E7 CC polypeptides, where the E7 polypeptide has mutations at any one or more CC of the amino acids corresponding to amino acids 24, 26 or 91 of the CC sequence given in ADO44073 and the E6 polypeptide has no mutations or has CC mutations at any one or more of the amino acids corresponding to amino acids 3 or 106 of there sequence given in ADO44072. The polypeptides of CC the invention are useful for treating or preventing human papillomavirus CC immune responses against HPV. They are also useful for treating lower CC castroints at all cracer. Cancers of anal cancer and other treating lower contents and the corresponded to the contents against HPV. They are also useful for treating lower contents and the cancer cancers of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             멹
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           á
                                                           The present sequence represents a fusion protein, comprising E6 and E7 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E6E7TetM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy CC terminus (where residues 24 and 26 have been replaced with glycine). CC E6E7TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, cc where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

                                                                                                                                                                                                                                                                                                                                                                                CC type B6 and B7 polypeptides from human papillomavirus type 16 (HPV16).

The specification describes human papillomavirus E7 and E7 polypeptides, where the B7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in AD044073 and the B6 polypeptide has no mutations or has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in AD044072. The polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

The polypeptide, or its DNA, is useful for active immunization without cross-reactivity and problems associated with the biological function of the protein. This sequence represents the human papillomavirus type 16 E7 protein which is used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC The present invention relates to an expression vector comprising a CC promoter, signal sequences, an antigen, a cell-binding element, and a CC polyadenylation sequence. The expression vector can be used directly or CC after transduction of antigen-presenting cells, in vaccines for treatment CC and prevention of cancer, infections and autoimmune diseases. Vectors CC similar to the expression vector of the present invention, but expressing CC that contain MHC-II restricted epitopes for activation of CD4+ cells or CC elicitation of an immune response in vivo. The identified polypeptides are CC (in APC) or vector containing DNA that expresses the polypeptides are CC (in APC) or vector containing DNA that expresses the polypeptides are CC which hamper the above conditions. The present sequence is HPV CC which hamper the secretion of the protein, which has a string of charged residues CC to result in the present protein, stablises the protein and facilitates CC secretion. The coding sequence for the present protein was used to CC construct the expression vector of the present invention. (Updated on 06-

The novel method comprises incubating an E6 or E7 peptide of HPV with a sample from the patient, and assaying the sample for a cell-mediated immune response against the peptide. The method is useful for determining the possibility and preventing the recurrence of a (pre-)cancerous growth in a patient infected with HPV or suspected of being infected with HPV. The HPV E6 or E7 peptides are useful in immunotherapy for the preventing or reducing the risk of development of (pre-)cancerous growths. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a new DNA sequence encodes an B6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced by codons which lead to enhanced translation in a mammalian cell, containing a mutation which results in production of a truncated non-functional protein, and encoding a highly immunogenic polypeptide fusion partner capable of enhancing immunogenicity of the E6 or E7 protein in the mammalian host. The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the human papillomavirus-16 (HPV16) EE7T-protein sequence of the invention
                                                                                                                                                                   Key

The prod. of the second reading frame is the HPV-16 E7 protein whereas the third reading frame encodes HPV-16 E6. The E6 and E7 ORPs are fused together to form a single continuous ORP via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. See also ARR27723-43. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant virus vectors encoding human papillomavirus proteins - for treating and vaccinating against HPV infections and conditions caused them, such as cervical cancer.

The vaccines can prevent or treat human papilloma virus infection. Such therapeutic vaccinations can be used for relief against, e.g. cervical carcinoma. Construction of chimeric proteins comprising amino acid residues from L1 protein, and e.g. E6 or E7 protein, which give rise to chimeric capsomers, combines prophylactic and therapeutic functions of a vaccine. Capsomers can promote elimination of persistently infected cells. Capsomers can also escape neutralization by pre-existing anti-capsid antibodies and hence possess longer circulating half-life as compared to chimeric virus-like particles. The fusion protein, which forms the capsomer, provides increased antigenicity. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                         Land
                                                    Reducing the proliferation of a cancer cell involves inhibiting ligand binding to an integrin receptor on the cancer cell, where the integrin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to compositions and methods for reducing the proliferation of cancer cells through interaction with integrins. The invention is useful for reducing the proliferation of cancer cells e.g. melanoma, adenoma, lymphoma, myeloma, carcinoma, glioma, plasmocytoma, sarcoma, thyoma, leukaemia, skin cancer, retinal cancer, breast cancer, prostate cancer, colon cancer, sophageal cancer, stomach cancer, pancreas cancer, brain tumours, lung cancer, ovarian cancer, cervical cancer, hepatic cancer, gastrointestinal cancer, and head and neck cancer cells. The invention is also useful for identifying a therapeutic target which involves assaying potential reagent for activity. The present sequence is human papillomavirus (HPV) type 16 E7 protein.
                      The present sequence represents the HPV16 E7 protein. HPV16 E7 was fused to a heat shock protein (Hsp), and used used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprises contacting naive lymphocytes in the detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp40, Hsp40, and Hsp71. The method may be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                Screening for compounds that stimulate Th1-like responses lymphocyte cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human papillomavirus
